

Layerscape® Access LA9310 Programmable Baseband Processor

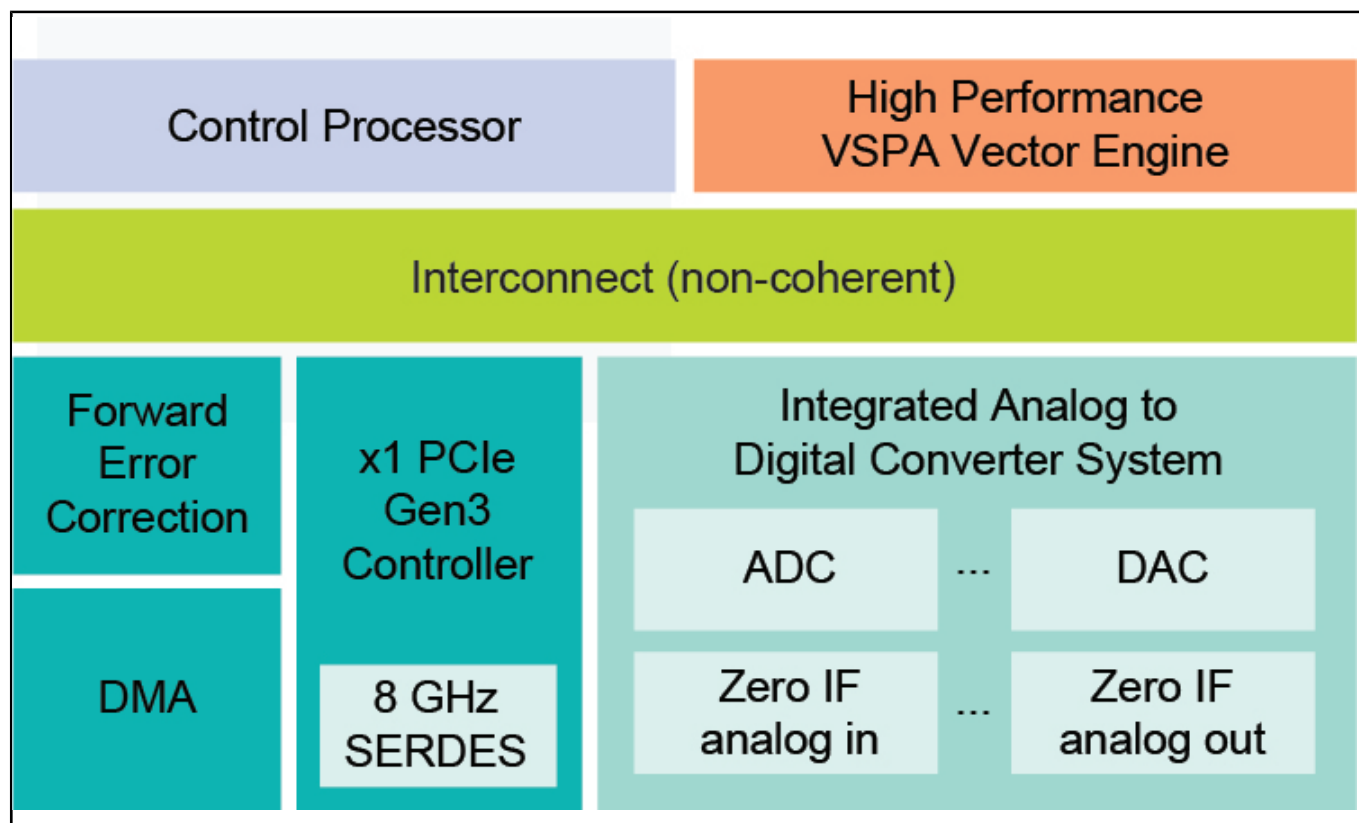

LA9310

Last Updated: May 30, 2025

The Layerscape® Access LA9310 programmable baseband processor is a digital signal processor with integrated data converters (ADC/DAC) for physical layer processing of 5G infrastructure, DFE, and custom communication systems at the network edge. Its low cost and power and programmable signal processing capabilities make it an attractive option to expensive FPGAs in applications such as network listening, small-scale radio units and repeaters.

The ADC / DAC supports a zero-IF I/Q interface to an RFIC suitable for both sub-6GHz and limited bandwidth mmWave applications. NXP's VSPA DSP implements sample-level baseband processing in the digital domain, enabling a flexible software defined radio.
